

Explainable AI Tasks and Questions

Task	Questions to answer			
	Stage 1: Model diagnosis	Stage 2: Model improvement	Stage 3: Model selection	Stage 4: Stakeholder communication
Accuracy	What is the model's performance (precision, recall, F1, etc.)?		How do performance metrics vary between models?	How accurate is the model?
Bias	Is the data biased?	How can the model compensate for data bias?		
Check stakeholder understanding				Do stakeholders understand the explanation?
Class separation	Which features discriminate between classes?	What do the false positive clusters contain?		
Decision boundary	How do predictions change during a model run?			
Example model predictions	How do features affect predictions?			How does model output compare to real data?
Feature dependency	How do a feature's values affect the model's predictions? How do a feature's values vary between classes? How do predictions change through the levels of a model?			
Feature importance	Which features are most important (global/local)?		How does feature importance vary between models?	
Feature interaction	How do a model's predictions change depending on the values of multiple features?			What does the model predict for stakeholders?
Justification for decision				Can you provide a simple explanation of the decision?
Misclassified	Are any instances misclassified? How many errors occur of each type? What type of errors occur? Which instances are 'easy' vs. 'hard' to predict?	Do model improvements correct the misclassifications?	Which instances do different models always predict correct (or wrong)? Which instances do different models disagree on?	
Robustness		Are all instances in a cluster?		
Uncertainty	How does model input affect uncertainty?			How often is the model uncertain?
